## TELEPHONE SPEECH NETWORK WITH DIALER INTERFACE

ILA1062/1062A

## FEATURES

- Low DC line voltage; operates down to 1.6 V (excluding polarity guard)
- Voltage regulator with adjustable static resistance
- Provides a supply for external circuits
- Symmetrical high-impedance inputs ( $64 \mathrm{k} \Omega$ ) for dynamic, magnetic or piezo-electric microphones
- Asymmetrical high-impedance input ( $32 \mathrm{k} \Omega$ ) for electrets microphones
- DTMF signal input with confidence tone
- Mute input for pulse or DTMF dialing
- ILA1062: active HIGH (MUTE)
- ILA1062A: active LOW (MUTE)
- Receiving amplifier for dynamic, magnetic or piezo-electric earpieces
- Large gain setting range on microphone and earpiece amplifiers
- Line loss compensation (line current dependent) for microphone and earpiece amplifiers
- Gain control curve adaptable to exchange supply
- DC line voltage adjustment facility

ORDERING INFORMATION

| Device | Operating <br> Temperature Range | Package | Packing |
| :---: | :---: | :---: | :---: |
| ILA1062N | $T_{A}=-25^{\circ}$ to $75^{\circ} \mathrm{C}$ | DIP8 | Tube |
| ILA1062AN |  | DIP8 | Tube |
| ILA1062D |  | SOP8 | Tube |
| ILA1062AD |  | SOP8 | Tube |
| ILA1062DT |  | SOP8 | Tape \& Reel |
| ILA1062ADT |  | SOP8 | Tape \& Reel |

## PIN CONNECTION

## DESCRIPTION

The ILA1062 and ILA1062A are integrated circuits that perform all speech and line interface functions required in fully electronic telephone sets. They perform electronic switching between dialing and speech. The ICs operates at line voltage down to 1.6 V DC (with reduced performance) to facilitate the use of more telephone sets connected in parallel.
All statements and values refer to all versions unless otherwise specified. The ILA1062 (ILA1062A) is packaged in a standard 16-pin plastic DIP and special plastic DIP with internal heatsink is also available.

## QUICK REFERENCE DATA

## BLOCK DIAGRAM

(1) Pin 12 is active HIGH (MUTE) for ILA1062.

Fig. 1 Block diagram of ILA1062A

## FUNCTIONAL DESCRIPTION

Supplies $\mathbf{V}_{\mathrm{CC}}$, LN, SLPE, REG and STAB

Power for the IC and its peripheral circuits is usually obtained from the telephone line. The supply voltage is delivered from the line via a dropping resistor and regulated by the IC. The supply voltage $\mathrm{V}_{\mathrm{CC}}$ may also be used to supply external circuits e.g. dialing and control circuits.

Decoupling of the supply voltage is performed by a capacitor between $\mathrm{V}_{\mathrm{CC}}$ and $\mathrm{V}_{\mathrm{EE}}$. The internal voltage regulator is decoupled by a capacitor between REG and $\mathrm{V}_{\mathrm{EE}}$.

The DC current flowing into the set is determined by the exchange supply voltage $\mathrm{V}_{\text {exch }}$, the feeding bridge resistance $\mathrm{R}_{\text {exch }}$ and the DC resistance of the telephone line $\mathrm{R}_{\text {line }}$.

The circuit has internal current stabilizer operating at a level determined by a $3.6 \mathrm{k} \Omega$ resistor connected between STAB and $\mathrm{V}_{\mathrm{EE}}$ (see Fig.6). When the line current $\left(\mathrm{I}_{\text {line }}\right)$ is more than 0.5 mA greater than the sum of the IC supply current $\left(\mathrm{I}_{\mathrm{CC}}\right)$ and the current drawn by the peripheral circuitry connected to $\mathrm{V}_{\mathrm{CC}}\left(\mathrm{I}_{\mathrm{p}}\right)$ the excess current is shunted to $\mathrm{V}_{\mathrm{EE}}$ via LN .

The regulated voltage on the line terminal $\left(\mathrm{V}_{\mathrm{LN}}\right)$ can be calculated as:

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{LN}}=\mathrm{V}_{\text {ref }}+\mathrm{I}_{\text {SLPE }} \times \mathrm{R} 9 \\
& \mathrm{~V}_{\mathrm{LN}}=\mathrm{V}_{\text {ref }}+\left\{\left(\mathrm{I}_{\text {line }}-\mathrm{I}_{\mathrm{CC}}-0.5 \times 10^{-3} \mathrm{~A}\right)-\mathrm{I}_{\mathrm{p}}\right\} \times \mathrm{R} 9
\end{aligned}
$$

$\mathrm{V}_{\text {ref }}$ is an internally generated temperature compensated reference voltage of 3.7 V and R9 is an external resistor connected between SLPE and $\mathrm{V}_{\text {EE }}$.

In normal use the value of R9 would be $20 \Omega$.
Changing the value of R9 will also affect microphone gain, DTMF gain, gain control characteristics, sidetone level, maximum output swing on LN and the DC characteristics (especially at the lower voltages).

Fig. 2 Equivalent impedance circuit

Under normal conditions, when $\mathrm{I}_{\text {SLPE }} \gg \mathrm{I}_{\mathrm{CC}}+0.5 \mathrm{~mA}+$ $\mathrm{I}_{\mathrm{p}}$, the static behaviour of the circuit is that of a 3.7 V regulator diode with an internal resistance equal to that of R9. In the audio frequency range the dynamic impedance is largely determined by R1. Fig. 2 show the equivalent impedance of the circuit.
At line currents below 9 mA the internal reference voltage is automatically adjusted to a lower value (typically 1.6 V at 1 mA ). This means that more sets can be operated in parallel with DC line voltage (excluding the polarity guard) down to an absolute minimum voltage of 1.6 V . At line currents below 9 mA the circuit has limited sending and receiving levels. The internal reference voltage can be adjusted by means of an external resistor ( $\mathrm{R}_{\mathrm{VA}}$ ). This resistor when connected between LN and REG will decrease the internal reference voltage and when connected between REG and SLPE will increase the internal reference voltage.

## Microphone inputs MIC+ and MIC- and gain pins GAS1 and GAS2

The circuit has symmetrical microphone inputs. Its input impedance is $64 \mathrm{k} \Omega(2 \times 32 \mathrm{k} \Omega)$ and its voltage gain is typically 52 dB (when R7 $=68 \mathrm{k} \Omega$; see Fig.6).
Dynamic, magnetic, piezo-electric or electret (with built-in FET source followers) can be used.

The gain of the microphone amplifier can be adjusted between 44 dB and 52 dB to suit the sensitivity of the transducer in use. The gain is proportional to the value of R7 which is connected between GAS1 and GAS2.

Stability is ensured by two external capacitors, C6 connected between GAS1 and SLPE and C8 connected between GAS1 and VEE. The value of C6 is 100 pF but this may be increased to obtain a first-order low-pass filter. The value of C8 is 10 times the value of C6. The cut-off frequency corresponds to the time constant R7 x C6.

## Input MUTE (ILA1062A)

When MUTE is LOW or open-circuit, the DTMF input is enable and the microphone and receiving amplifier inputs are inhibited. The reverse is true when MUTE is HIGH.
MUTE switching causes only negligible clicking on the line and earpiece output. If the number of parallel sets in use causes a drop in line current to below 6 mA the DTMF amplifier becomes active independent to the DC level applied to the MUTE input.

## Dual-tone multi-frequency input DTMF

When the DTMF input is enable dialing tones may be sent on to the line. The voltage gain from DTMF to LN is typically 25.5 dB (when $\mathrm{R} 7=68 \mathrm{k} \Omega$ ) and varies with R7 in the same way as the microphone gain. The signaling tones can be heard in the earpiece at a low level (confidence tone).

## Receiving amplifier IR, QR and GAR

The receiving amplifier has one input (IR) and a noninverting output (QR). The IR to QR gain is typically 31 dB (when $\mathrm{R} 4=100 \mathrm{k} \Omega$ ). It can be adjusted between 20 and 31 dB to match the sensitivity of the transducer in use. The gain is set with the value of R4 which is connected between GAR and QR. The overall receive gain, between LN and QR , is calculated by subtracting the anti-sidetone network attenuation (32dB) from the amplifier gain. Two external capacitors, C4 and C7, ensure stability. C4 is normally 100 pF and C 7 is 10 times the value of C4. The value of C4 may be increased to obtain a first-order low-pass filter. The cut-off frequency will depend on the time constant R4 x C4.

The output voltage of the receiving amplifier is specified for continuous-wave drive. The maximum output voltage will be higher under speech conditions where the peak to RMS ratio is higher.

## Automatic gain control input AGC

Automatic line loss compensation is achieved by connecting a resistor (R6) between AGC and $\mathrm{V}_{\text {EE }}$.
The automatic gain control varies the gain of the microphone amplifier and the receiving amplifier in accordance with the DC line current. The control range is 5.8 dB which corresponds to a line length of 5 km for a 0.5 mm diameter twisted-pair copper cable with a DC resistance of $176 \mathrm{~dB} / \mathrm{km}$ and average attenuation of $1.2 \mathrm{~dB} / \mathrm{km}$. Resistor R6 should be chosen in accordance with the exchange supply voltage and its feeding bridge resistance. The ratio of start and stop currents of the AGC curve is independent of the value of R6. If no
automatic line-loss compensation is required the AGC pin may be left open-circuit. The amplifiers, in this condition, will give their maximum specified gain.

## Sidetone suppression

The anti-sidetone network, $\mathrm{R} 1 / / \mathrm{Z}_{\text {line }}, \mathrm{R} 2, \mathrm{R} 3, \mathrm{R} 8, \mathrm{R} 9$ and $\mathrm{Z}_{\text {bal }}$ suppresses the transmitted signal in the earpiece. Maximum compensation is obtained when the following conditions are fulfilled:
$R 9 \times R 2=R 1 \times R 3+\binom{R 8 \times Z_{\text {bal }}}{R 8+Z_{\text {bal }}}$
$\frac{\text { Zbal }}{Z_{\text {bal }}+\text { R } 8}=\frac{\text { Zline }}{\text { Zline }+ \text { R1 }}$

If fixed values are chosen for R1, R2, R3 and R9, then condition (1) will always be fulfilled when
To obtain optimum sidetone suppression, condition (2) has to be fulfilled which results in:
$Z_{\text {bal }}=\frac{\mathrm{R} 8}{\mathrm{R} 1} \times \mathrm{Z}_{\text {line }}=\mathrm{kx} \mathrm{Z}_{\text {line }}$
Where $k$ is scale factor; $k=\frac{R 8}{R 1}$
The scale factor $k$, dependent on the value of $R 8$, is chosen to meet the following criteria:

- compatibility with a standard capacitor from the E6 or E12 range for $\mathrm{Z}_{\text {bal }}$
$-\left|\mathrm{Z}_{\text {bal }} / / \mathrm{R} 8\right| \ll \mathrm{R} 8$ fulfilling condition (a) and thus ensuring correct anti-sidetone bridge operation
$-\left|\mathrm{Z}_{\text {bal }}+\mathrm{R} 8\right| \gg \mathrm{R} 9$ to avoid influencing the transmit gain. In practise $\mathrm{Z}_{\text {line }}$ varies considerably with the line type and length. The value chosen for $\mathrm{Z}_{\text {bal }}$ should therefore be for an average line thus giving optimum setting for short or long lines.

## ABSOLUTE MAXIMUM RATING

| Characteristic |  | Symbol | Test Condition | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Positive Continuous Line Voltage |  | $\mathrm{V}_{\text {LN }}$ |  |  |  | 12 | V |
| Repetitive Line Voltage During Switch-on or Line Interruption |  | $\mathrm{V}_{\mathrm{LN}(\mathrm{R})}$ |  |  |  | 13.2 | V |
| Repetitive Peak Line Voltage for a 1ms Pulse per 5s |  | $\mathrm{V}_{\mathrm{LN}(\mathrm{RM})}$ | $\begin{gathered} \text { R9 }=20 \Omega ; \text { R10 }=13 \Omega ; \\ \text { see Fig. } 6 \end{gathered}$ |  |  | 28 | V |
| Line Current |  | $\mathrm{I}_{\text {line }}$ | R9 = 20ת; note 1 |  |  | 140 | mA |
| Input Voltage on all other Pins |  | $\mathrm{V}_{\mathrm{I}}$ |  | -0.7 |  | $\mathrm{V}_{\mathrm{CC}}+0.7$ | V |
| Total Power | Standard DIP | $\mathrm{P}_{\text {tot }}$ | R9 = 20ת; note 2 |  |  | 0.58 | W |
| Dissipation | DIP with heatsink |  |  |  |  | 0.67 |  |
| Operating Ambient Temperature |  | $\mathrm{T}_{\mathrm{A}}$ |  | -25 |  | +75 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature |  | $\mathrm{T}_{\mathrm{stg}}$ |  | -40 |  | +125 | ${ }^{\circ} \mathrm{C}$ |
| Junction Temperature |  | $\mathrm{T}_{\mathrm{i}}$ |  |  |  | +125 | ${ }^{\circ} \mathrm{C}$ |

## Notes

1. Mostly dependent on the maximum required $T_{A}$ and on the voltage between LN and SLPE.
2. Calculated for the maximum ambient temperature specified and a maximum junction temperature of $125^{\circ} \mathrm{C}$.
(Thermal Resistance R $_{J A}=85^{\circ} \mathrm{C} / \mathrm{W}$ for standard DIP and $\mathrm{R}_{\mathrm{JA}}=75^{\circ} \mathrm{C} / \mathrm{W}$ for special DIP with heatsink).
3. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied.
Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## TABLE 1

Values of resistor R6 for optimum line-loss compensation at various values of exchange supply voltage ( $\mathrm{V}_{\text {exch }}$ ) and exchange bridge resistance ( $\mathrm{R}_{\text {exch }}$ ); R9 $=20 \Omega$.

| $\mathbf{V}_{\text {exch }}(\mathrm{V})$ | $\mathbf{4 0 0} \mathrm{R}_{\text {exch }}(\boldsymbol{\Omega})$ | $\mathbf{6 0 0} \mathrm{R}_{\text {exch }} \mathbf{( \Omega )}$ | $\mathbf{8 0 0} \mathbf{R}_{\text {exch }} \mathbf{( \Omega )}$ | $\mathbf{1 0 0 0} \mathbf{R}_{\text {exch }}(\boldsymbol{\Omega})$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{R 6}(\mathbf{k} \boldsymbol{\Omega})$ |  |  |  |  |
| 36 | 100 | 78.7 | - | - |
| 48 | 140 | 110 | 93.1 | 82 |
| 60 | - | - | 120 | 102 |

PINNING

| Pin | Symbol | Description |
| :---: | :---: | :--- |
| 1 | LN | Positive Line Terminal |
| 2 | GAS1 | Gain Adjustment; Transmitting Amplifier |
| 3 | GAS2 | Gain Adjustment; Transmitting Amplifier |
| 4 | QR | Non-inverting Output; Receiving Amplifier |
| 5 | GAR | Gain Adjustment; Receiving Amplifier |
| 6 | MIC- | Inverting Microphone Input |
| 7 | MIC+ | Non-inverting Microphone Input |
| 8 | STAB | Current Stabilizer |
| 9 | VEE | Negative Line Terminal |
| 10 | IR | Receiving Amplifier Input |
| 11 | DTMF | Dual-tone Multi-Frequency Input |
| 12 | $\overline{\text { MUTE }}$ | Mute Input (see note 1) |
| 13 | VCC | Positive Supply Decoupling |
| 14 | REG | Voltage Regulator Decoupling |
| 15 | AGC | Automatic Gain Control Input |
| 16 | SLPE | Slope (DC resistance) Adjustment |

Note 1. Pin 12 is active HIGH (MUTE) for ILA1062

## APPLICATION INFORMATION

Fig. 6 Typical application of ILA1062A, with piezo-electric earpiece and DTMF dialing

N SUFFIX PLASTIC DIP
(MS - 001BB)

NOTES:

1. Dimensions "A", "B" do not include mold flash or protrusions.

Maximum mold flash or protrusions $0.25 \mathrm{~mm}(0.010)$ per side.

|  | Dimension, mm |  |
| :---: | :---: | :---: |
| Symbol | MIN | MAX |
| $\mathbf{A}$ | 18.67 | 19.69 |
| $\mathbf{B}$ | 6.1 | 7.11 |
| $\mathbf{C}$ |  | 5.33 |
| $\mathbf{D}$ | 0.36 | 0.56 |
| $\mathbf{F}$ | 1.14 | 1.78 |
| $\mathbf{G}$ | 2.54 |  |
| $\mathbf{H}$ | 7.62 |  |
| $\mathbf{J}$ | $0^{\circ}$ | $10^{\circ}$ |
| $\mathbf{K}$ | 2.92 | 3.81 |
| $\mathbf{L}$ | 7.62 | 8.26 |
| $\mathbf{M}$ | 0.2 | 0.36 |
| $\mathbf{N}$ | 0.38 |  |
