# 1 GENERAL DESCRIPTION

## 1.1 INTRODUCTION

The ST6200L/01L and 03L are low voltage mask programmed ROM version of ST62T00C,T01C and T03C OTP devices.

They offer the same functionality as OTP devices, selecting as ROM options the options defined in the programmable option byte of the OTP version, with the exception of the LVD Reset and the OSG that are not available.

Figure 1. Programming wave form

## 1.2 ROM READOUT PROTECTION

If the ROM READOUT PROTECTION option is selected, a protection fuse can be blown to prevent any access to the program memory content.

In case the user wants to blow this fuse, high voltage must be applied on the TEST pin.

Note: ZPD15 is used for overvoltage protection

**1.3 ORDERING INFORMATION**

The following section deals with the procedure for transfer of customer codes to SGS-THOMSON.

**1.3.1 Transfer of Customer Code**

Customer code is made up of the ROM contents and the list of the selected mask options. The ROM contents are to be sent on diskette, or by electronic means, with the hexadecimal file generated by the development tool. All unused bytes must be set to FFh.

The selected mask options are communicated to SGS-THOMSON using the correctly filled OPTION LIST appended.

**1.3.2 Listing Generation and Verification**

When SGS-THOMSON receives the user's ROM contents, a computer listing is generated from it. This listing refers exactly to the mask which will be used to produce the specified MCU. The listing is then returned to the customer who must thoroughly check, complete, sign and return it to SGS-THOMSON. The signed listing forms a part of the contractual agreement for the creation of the specific customer mask.

The SGS-THOMSON Sales Organization will be pleased to provide detailed information on contractual points.

## 2 ELECTRICAL CHARACTERISTICS

### 2.1 ABSOLUTE MAXIMUM RATINGS

This product contains devices to protect the inputs against damage due to high static voltages, however it is advisable to take normal precaution to avoid application of any voltage higher than the specified maximum rated voltages.

For proper operation it is recommended that  $V_I$  and  $V_O$  be higher than  $V_{SS}$  and lower than  $V_{DD}$ . Reliability is enhanced if unused inputs are connected to an appropriate logic voltage level ( $V_{DD}$  or  $V_{SS}$ ).

**Power Considerations** The average chip-junction temperature,  $T_j$ , in Celsius can be obtained from:

$$T_j = T_A + P_D \times R_{thJA}$$

Where:  $T_A$  = Ambient Temperature.

$R_{thJA}$  = Package thermal resistance (junction-to ambient).

$P_D = P_{int} + P_{port}$ .

$P_{int} = I_{DD} \times V_{DD}$  (chip internal power).

$P_{port}$  = Port power dissipation (determined by the user).

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage	-0.3 to 7.0	V
$V_I$	Input Voltage	$V_{SS} - 0.3$ to $V_{DD} + 0.3^{(1)}$	V
$V_O$	Output Voltage	$V_{SS} - 0.3$ to $V_{DD} + 0.3^{(1)}$	V
$I_O$	Current Drain per Pin Excluding $V_{DD}$ , $V_{SS}$	$\pm 10$	mA
$I_{V_{DD}}$	Total Current into $V_{DD}$ (source)	50	mA
$I_{V_{SS}}$	Total Current out of $V_{SS}$ (sink)	50	mA
$T_j$	Junction Temperature	150	°C
$T_{STG}$	Storage Temperature	-60 to 150	°C

**Notes:**

- Stresses above those listed as "absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
- (1) Within these limits, clamping diodes are guarantee to be not conductive. Voltages outside these limits are authorised as long as injection current is kept within the specification.

2.2 RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
T <sub>A</sub>	Operating Temperature	1 Suffix Version	0		70	°C
V <sub>DD</sub>	Operating Supply Voltage	f <sub>OSC</sub> = 2MHz f <sub>OSC</sub> = 4MHz	2.4 3		3.9 3.9	V
f <sub>OSC</sub>	Oscillator Frequency <sup>2)</sup>	V <sub>DD</sub> = 2.4V V <sub>DD</sub> = 3.0V	0 0		2.0 4.0	MHz
I <sub>INJ+</sub>	Pin Injection Current (positive)	V <sub>DD</sub> = 2.4 to 3.9V			+5	mA
I <sub>INJ-</sub>	Pin Injection Current (negative)	V <sub>DD</sub> = 2.4 to 3.9V			-5	mA

Notes:

1. Care must be taken in case of negative current injection, where adapted impedance must be respected on analog sources to not affect the A/D conversion. For a -1mA injection, a maximum 10 KΩ is recommended.
2. An oscillator frequency above 1MHz is recommended for reliable A/D results

The shaded area is outside the recommended operating range; device functionality is not guaranteed under these conditions.
